Arthritis: Should I Have Knee Replacement Surgery?

Here’s a record of your answers. You can use it to talk with your doctor or loved ones about your decision.

1. Get the facts
2. Compare your options
3. What matters most to you?
4. Where are you leaning now?
5. What else do you need to make your decision?

1. Get the facts

Your options

- Have surgery to replace your knee.
- Don't have this surgery. Instead, use other treatments, like exercise, medicines, or another type of surgery.

Key points to remember

- The decision you and your doctor make depends on your age, health, and activity level, and on how much pain and disability you have.
- Most people have knee replacement only when they can no longer control arthritis pain with medicine and other treatments and when the pain really interferes with their lives.
- Rehabilitation after knee replacement requires daily exercises for several weeks.
- Most knee replacements last for at least 15 years. Some people need to have the knee replaced again.

FAQs

What is osteoarthritis?

Osteoarthritis is a problem with the cartilage in joints. Over time, the cartilage breaks down until the bones, which were once separated by cartilage, rub against each other. This causes damage to tissue and bone. The symptoms of osteoarthritis include joint pain, stiffness after inactivity, and limited motion.
What is knee replacement surgery?

Knee replacement surgery (See figure in appendix) may be used when a person can no longer control knee pain with other treatments and when the pain disrupts his or her life.

The surgeon covers the ends of the damaged thighbone and lower leg bone, and usually the kneecap, with artificial (man-made) surfaces that are lined with metal and plastic. The artificial pieces are cemented to the bones.

Rehabilitation, or rehab, is usually intense after surgery. Most people start to walk with a walker or crutches the day of surgery or the next day. And they begin physical therapy right away. Your doctor may advise you to ride a stationary bike to strengthen your leg muscles and improve how well you can bend your knee. Rehab will take several weeks, but you should be able to start walking, climbing stairs, sitting in and getting up from chairs, and doing other daily activities within a few days.

Surgery is only for people with severe osteoarthritis who do not get pain relief from medicine, home treatment, or other methods and who have lost a lot of cartilage. Surgery relieves severe, disabling pain and may restore the knee’s ability to work properly.

What other surgeries are used to treat osteoarthritis?

Besides knee replacement, the other types of surgeries used are:

<table>
<thead>
<tr>
<th>Surgery</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arthrodesis</td>
<td>This is surgery that joins (fuses) two bones in a diseased joint so that the joint can no longer move. It is rarely used in the knees, but it may be a treatment choice in cases of severe osteoarthritis in a young person who cannot have total knee replacement.</td>
</tr>
<tr>
<td>Arthroscopy</td>
<td>Arthroscopy may be used to smooth a rough joint surface or remove loose cartilage or bone fragments. But it is not usually recommended for osteoarthritis of the knee.</td>
</tr>
<tr>
<td>Osteotomy</td>
<td>This surgery corrects knee problems such as bowleg and knock-knee. It is usually done for younger, active people who have mild arthritis and who want to delay knee replacement.</td>
</tr>
</tbody>
</table>

What other treatments are available?

There are a number of treatments for arthritis in the knee that don't involve surgery:

- **Medicine**. If your pain is mild, you may only need pain medicines that you can buy without a prescription. Stronger medicines that are used to treat osteoarthritis include:
Tramadol.
Steroid injections.
Opioids.

- **Ice or heat.** Heat may help you loosen up your joints before an activity. Ice is a good pain reliever after activity or exercise.
- **Exercise.** Exercise helps because it makes your muscles stronger, which lowers the stress on your knees. But make sure to talk to your doctor about what kind of activity is best for you.
- **Physical therapy** or occupational therapy.
- **Walking aids.** There are many devices you can use to take some of the stress off of your knee. These include crutches, walkers, braces, and tape. You may also be able to reduce the stress on your knee by wearing the right shoes or by adding insoles to your shoes. Talk to your doctor or physical therapist about what would be best for you.

**What are the risks of knee replacement surgery?**

Most people have much less pain after knee replacement surgery and are able to return to many of their activities. But as with any surgery, there are some risks, including:

- **Lack of good range of motion.** After surgery, some people can't bend their knee far enough to do their daily activities, even after several weeks. Medicine may help.
- **Dislocated kneecap.** If this happens, the kneecap may move to one side of the knee, and it will "pop" back when you bend your knee. It usually needs to be treated with another surgery. But this problem is not common.
- **Blood clots.** These can be dangerous if they block blood flow from the leg back to the heart or move to the lungs. They are more common in older people, those who are very overweight, those who have had blood clots before, and those who have cancer.
- **Wound-healing problems.** These are more common in people who take steroid medicines or who have diseases that affect the immune system, such as rheumatoid arthritis and diabetes. People who have any sort of artificial material in their bodies, including artificial joints, have a risk of infection around the material. But infection is rare. There is also a small risk of infection with any surgery.
- **Instability in the joint.** The knee may be unstable or wobbly if the replacement parts are not properly aligned. You may need a second surgery to align the parts correctly so that your knee is stable.
- **The usual risks of general anesthesia.** Problems from anesthesia are not common, especially in people who are in good health overall. But all anesthesia has some risk.

**What do numbers tell us about the benefits and risks of knee replacement?**

<table>
<thead>
<tr>
<th>Outcomes after surgery</th>
<th>Number of people</th>
</tr>
</thead>
<tbody>
<tr>
<td>People who are satisfied with their pain level 1 year after surgery</td>
<td>71 to 85 out of 100 (710 to 850 out of 1,000)</td>
</tr>
<tr>
<td>People who are satisfied overall 2 to 17 years after surgery</td>
<td>82 out of 100 (820 out of 1,000)</td>
</tr>
<tr>
<td>Need for repeat surgery within 15 years</td>
<td>12 out of 100 (120 out of 1,000)</td>
</tr>
<tr>
<td>--------------------------------------</td>
<td>----------------------------------</td>
</tr>
<tr>
<td>Serious joint infection within 10 years after surgery</td>
<td>1 out of 100 (10 out of 1,000)</td>
</tr>
<tr>
<td>Death within 4 to 6 weeks after surgery</td>
<td>Less than 1 out of 100 (2 to 6 out of 1,000)</td>
</tr>
</tbody>
</table>

*Based on the best available evidence (evidence quality: moderate to high)*

**Satisfaction with surgery**

The evidence about knee replacement surgery suggests that most people are happy with the results. The quality of this evidence is moderate.

Take a group of 100 people who have the surgery (See figure in appendix).

- 2 to 17 years later, 82 out of 100 will be satisfied overall. This means that 18 out of 100 will not be satisfied.
- 1 year later, 71 to 85 people out of 100 will be satisfied with their pain level. This means that 15 to 29 people out of 100 will not be satisfied.

**Need for repeat surgery**

Most artificial knees last for many years. But they can wear out or have other problems. Some people have to repeat the surgery to have the joint replaced again. The quality of the evidence about the need for repeat surgery is high.

Take a group of 100 people who have the surgery (See figure in appendix). Within 15 years after surgery, 12 out of 100 will need to have the knee replaced again. This means that 88 out of 100 will not need to repeat the surgery within the first 15 years.

**Problems after surgery**

The evidence suggests that, like most surgeries, knee replacement may have some risks. The quality of this evidence is moderate to high.

Take a group of 1,000 people who have the surgery (See figure in appendix). Rare but serious problems that can occur include:

- **Serious joint infection.** Within 10 years of surgery, 10 out of 1,000 people (or 1 out of 100) will get a serious infection. This means that 990 people out of 1,000 will not get an infection.
- **Death,** which may or may not be caused by the surgery itself. Within 4 to 6 weeks of surgery, 2 to 6 out of 1,000 people (or less than 1 out of 100) will die. This means that 994 to 998 people out of 1,000 who had the surgery will not die within 4 to 6 weeks.

**Understanding the evidence**

Some evidence is better than other evidence. Evidence comes from studies that look at how well treatments and tests work and how safe they are. For many reasons, some studies are more
reliable than others. The better the evidence is—the higher its quality—the more we can trust it.

The information shown here is based on the best available evidence.\(^1,2,3,4,5\) The evidence is rated using four quality levels: high, moderate, borderline, and inconclusive.

Another thing to understand is that the evidence can't predict what's going to happen in your case. When evidence tells us that 2 out of 100 people who have a certain test or treatment may have a certain result and that 98 out of 100 may not, there's no way to know if you will be one of the 2 or one of the 98.

**Why might your doctor recommend knee replacement surgery?**

Your doctor might recommend knee replacement if:

- You have very bad arthritis pain, and other treatments have not helped.
- You have lost a large amount of cartilage.
- You don't have health problems that would make it dangerous for you to have surgery.

## 2. Compare your options

\(^1\) Reference 1
\(^2\) Reference 2
\(^3\) Reference 3
\(^4\) Reference 4
\(^5\) Reference 5
Your knee won't bend as far as it did before you started having knee problems.
You may need to avoid activities that put a lot of stress on the joint, like running or playing tennis.
You may eventually need another replacement, because the artificial joint can wear out.

There are no bad effects from home treatments such as staying at a healthy weight, exercising, and using heat and cold therapy.

Personal stories

Are you interested in what others decided to do? Many people have faced this decision. These personal stories may help you decide.

Personal stories about knee replacement surgery for osteoarthritis

These stories are based on information gathered from health professionals and consumers. They may be helpful as you make important health decisions.

"I've skied competitively since I was 6 years old. In my 20s, I had several knee injuries and surgeries. About 7 years ago, I started having a lot of pain in one knee, and my doctor said the only surgery left to do was to replace the knee. If I have the knee replaced, I won't be able to ski or run or do anything that puts a lot of stress on it. I can't do any of those things now because of the pain anyway. I don't know how I'm going to deal with that, since being an athlete has always been a big part of who I am. I'm worried about having my knee replaced when I'm so young, but with the amount of pain I'm having, I don't see any other choice."

— Chuck, age 45

"The pain in my knees, especially my left one, has gotten steadily worse in the last 20 years. The medicines just weren't working. It got so bad last year that I gave up on my flower garden. My doctor and I discussed knee replacement, but I consider that my last resort. My doctor and I developed a plan of swimming and healthy eating habits that will help me take off the extra weight I've put on. We agree that's the best thing I can do to keep my osteoarthritis from getting worse. We're going to try some different medicines too."

— Esmerelda, age 61

"I feel like I'm too young to have my knee replaced. But I definitely need something other than Tylenol for the pain. I asked my doctor about my other options. She said we can try joint injections and see how that works. I can always have the surgery later if I need it, but I'd sure like to put it off"
for as long as I can. I'll see if these joint injections make the pain better. My doctor says that as long as I can handle the pain, we can hold off on the surgery."

— George, age 57

"I was an avid tennis player for years, and it finally caught up with my knees. I had an osteotomy years ago, and it helped for a while. But now so much of my time is focused on the pain. I'm an active grandmother with no intention of missing out on my grandkids' activities. I know that surgery will mean a long period of exercising and rehabilitation, but it will be worth it to lose this stiffness and discomfort."

— Jean, age 71

### 3. What matters most to you?

Your personal feelings are just as important as the medical facts. Think about what matters most to you in this decision, and show how you feel about the following statements.

<table>
<thead>
<tr>
<th>Reasons to have knee replacement surgery</th>
<th>Reasons not to have knee replacement surgery</th>
</tr>
</thead>
<tbody>
<tr>
<td>I want to be able to do low-impact activities, such as swimming and golf, as well as chores and housework.</td>
<td>My knee doesn't really get in the way of the physical activities I like or need to do.</td>
</tr>
<tr>
<td>More important</td>
<td>Equally important</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>I have more bad days than good.</th>
<th>I have more good days than bad.</th>
</tr>
</thead>
<tbody>
<tr>
<td>More important</td>
<td>Equally important</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>I'm not worried about the chance of needing another replacement surgery later in life.</th>
<th>I'm worried about needing another surgery in 10 or 20 years.</th>
</tr>
</thead>
</table>
I'm ready and willing to do several weeks of physical therapy after the surgery.

I don't want, or I won't be able, to have several weeks of physical therapy.

I know that problems sometimes occur with surgery, but getting pain relief and getting back some use of my knee is worth the risk.

I'm very worried about problems from surgery.

My other important reasons:

My other important reasons:

4. Where are you leaning now?

Now that you've thought about the facts and your feelings, you may have a general idea of where you stand on this decision. Show which way you are leaning right now.
<table>
<thead>
<tr>
<th>Having knee replacement surgery</th>
<th>NOT having knee replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Leaning toward</td>
<td>Undecided</td>
</tr>
<tr>
<td>Leaning toward</td>
<td></td>
</tr>
</tbody>
</table>

5. What else do you need to make your decision?

Check the facts

1. Knee replacement surgery should be my first choice if I have osteoarthritis of the knee.
   - Yes
   - No
   - I'm not sure
   
   You're right. Knee replacement surgery should be considered only when other treatments—such as exercise, medicines, physical therapy, and a change in your daily activities—haven't worked to ease your symptoms.

2. I will be able to return to all my normal activities right after I have this surgery.
   - Yes
   - No
   - I'm not sure
   
   You are right. Rehabilitation after knee replacement surgery is usually intense and requires daily exercises for several weeks.

3. Although most surgeries last for at least 15 years, I may need to have my knee replaced again.
   - Yes
   - No
   - I'm not sure
   
   You are right. Most knee replacement surgeries last for at least 15 years. But some people do need to have another replacement later.

Decide what's next

1. Do you understand the options available to you?
   - Yes
2. Are you clear about which benefits and side effects matter most to you?
   ○ Yes
   ○ No

3. Do you have enough support and advice from others to make a choice?
   ○ Yes
   ○ No

Certainty

1. How sure do you feel right now about your decision?

<table>
<thead>
<tr>
<th>Not sure at all</th>
<th>Somewhat sure</th>
<th>Very sure</th>
</tr>
</thead>
</table>

2. Check what you need to do before you make this decision.
   ○ I'm ready to take action.
   ○ I want to discuss the options with others.
   ○ I want to learn more about my options.

3. Use the following space to list questions, concerns, and next steps.

Need for Repeat Knee Replacement

The information shown here is based on the best available evidence.

Risks From Knee Replacement Surgery

The information shown here is based on the best available evidence.
Inside a normal knee joint, thick cushioning (cartilage) covers and protects the ends of your bones. This is called hyaline cartilage. Another type of cartilage, called meniscal cartilage or meniscus, acts like a shock absorber between the bones and keeps the knee joint stable by spreading out the load evenly across the joint. The two menisci (plural of meniscus) protect and cushion the surface of the joint and the ends of your bones.
In osteoarthritis, the cartilage that protects and cushions the knee joint breaks down over time. As the cartilage wears down, the bone surfaces rub against each other. This damages the tissue and bone, causing pain. Osteoarthritis is common in the knee joints.
